Drawdowns

The drawdowns function returns magnitudes of drawdowns, as well as their peaks, troughs, and times of recovery.

```
> library("PMwR")
> library("zoo")
> dax <- zoo(DAX[[1]], as.Date(row.names(DAX)))
> dd <- drawdowns(dax)
> dd <- dd[order(dd$max, decreasing = TRUE), ]  ## sort by size
> dd
        peak     trough     recover      max

6  2014-05-27 2014-05-29 2014-05-30 0.000193
```

```
> par(bty = "n", las = 1, tck = 0.01,
+     mar = c(3, 3, 1, 1), mgp = c(2, 0.5, 0), ps = 9)
> plot(dax, xlab = "", ylab = "DAX")
> abline(v = dd$peak[1])
> abline(v = dd$trough[1])
```
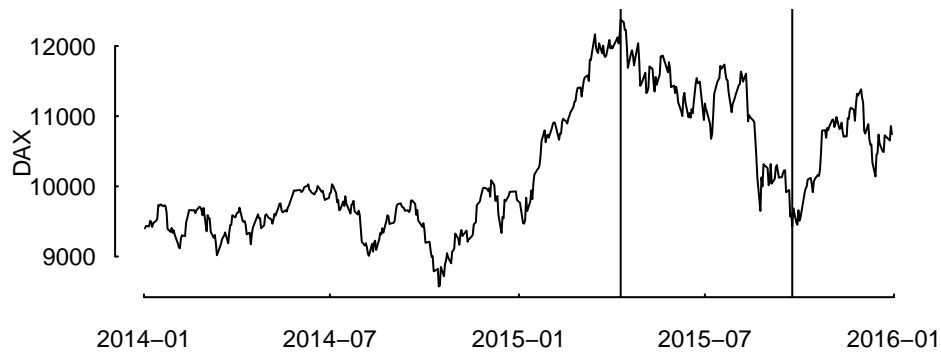

Streaks

The `streaks` function returns a data-frame of uninterrupted up and down movements, with uninterrupted meaning that no countermovement occured of `down` (`up`) percent or more during up (down) movements.

```
> up_down <- streaks(dax, up = 0.1, down = -0.1)
> up_down
       start        end state  return
1 2014-01-02 2014-03-13  <NA> -0.0407
2 2014-03-13 2014-07-03    up  0.1122
3 2014-07-03 2014-10-15  down -0.1453
4 2014-10-15 2015-04-10    up  0.4436
5 2015-04-10 2015-09-24  down -0.2382
6 2015-09-24 2015-11-30    up  0.2073
7 2015-11-30 2015-12-30  down -0.0562
```

You may use this information, for instance, to produce charts of up and down phases, such as the following. Note that the vertical scale is a log scale, i.e. a drop of 50% takes the same vertical distance as a rise of 100%.
